

Debug® Turbo

Storage Conditions and Cold Mixing Instructions

Storage Requirements:

Do not store at temperatures under 55° F.

Mixing Instructions In Cold Temperatures:

For best performance it is not recommended to mix Debug® Turbo in temperatures lower than 55° F. At that temp or below the wax in the oils has a tendency to congeal and clump. This clumping will tend to be more pronounced and noticeable as temperatures decrease below 55° F. If the product should begin to clump, warm up the concentrate to above 55° F and the issue will resolve. Also make sure the water temperature at time of mixing is not below 55° F as the same issue will arise.

Always read the Debug® Turbo product label and SDS instructions.
